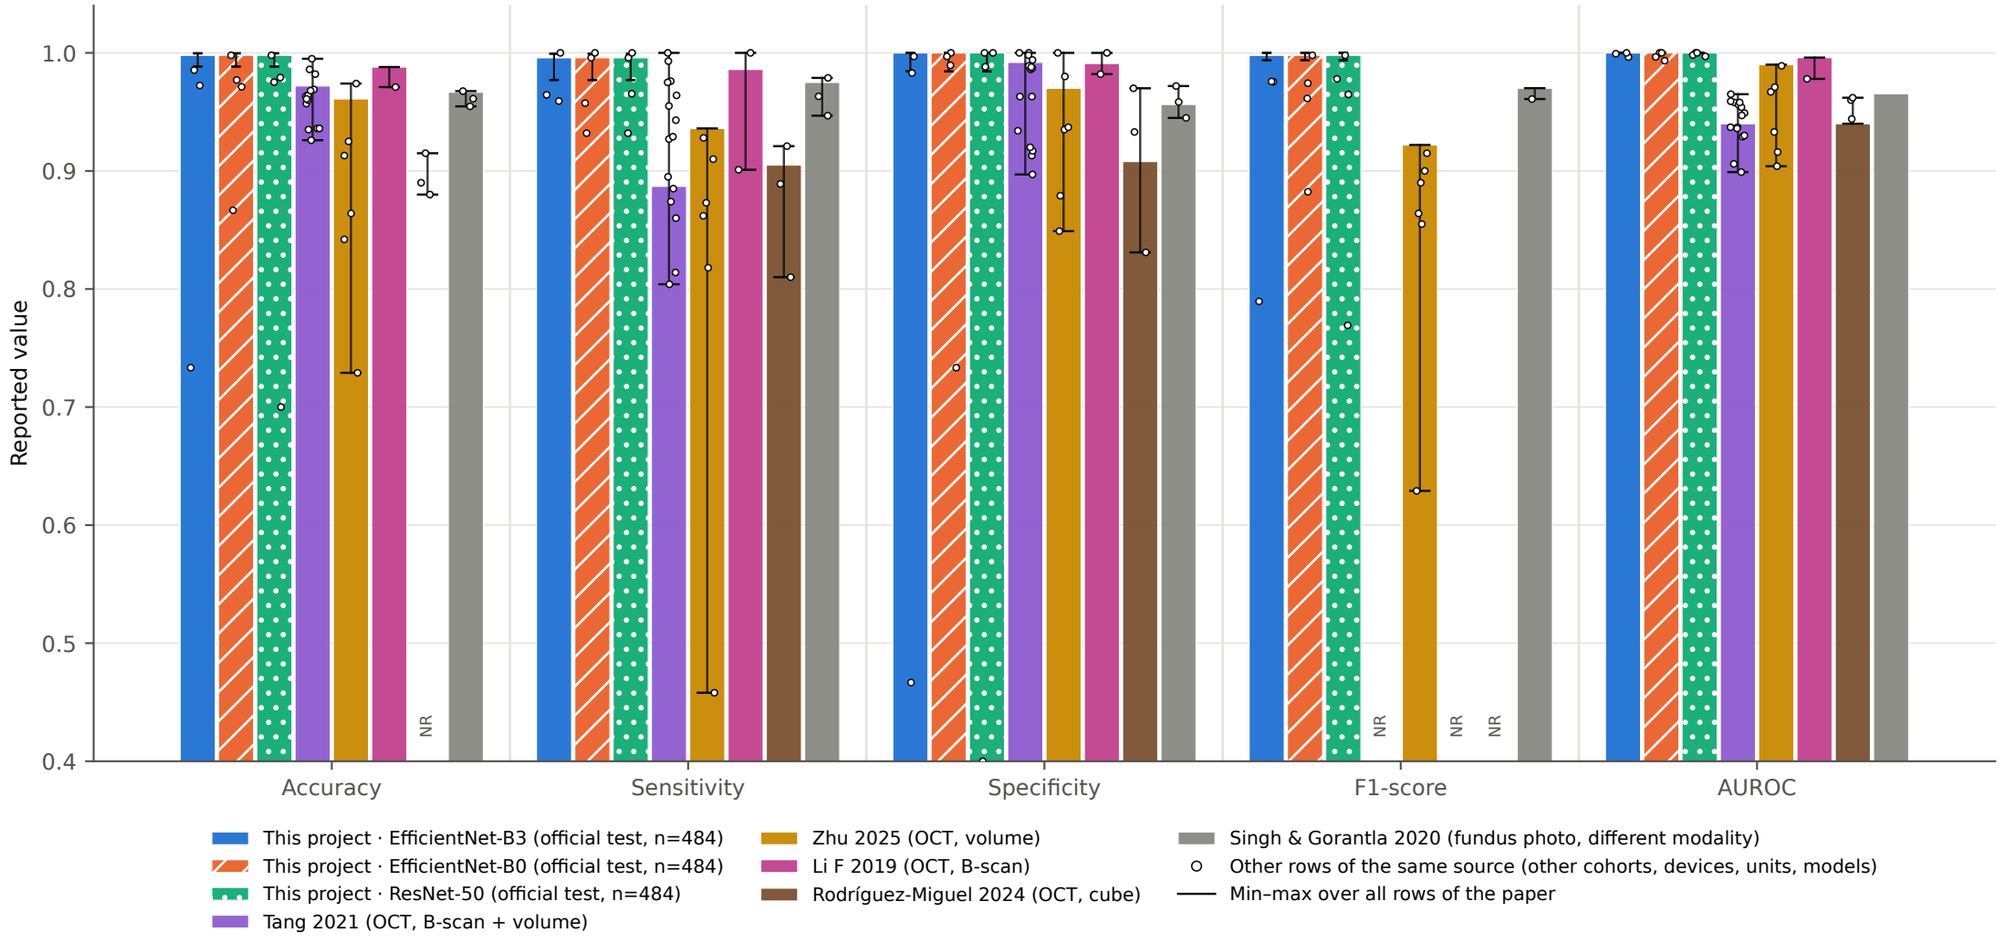
Performance of This Project's Models and the Five Published DME Classifiers, Metric by Metric



Bars: this project = official Kermany test split (242 DME / 242 Normal, threshold 0.5; Wilson 95% CI, F1 class-stratified bootstrap); each paper = its headline row (rule in 14_per_paper_comparison.py: internal B-scan/image-level result if reported, otherwise the main-text primary result).
Project dots = the same model on the unseen pool, OCTDL and Duke 2014 (volume). Not a head-to-head comparison: datasets, populations, devices, label definitions and evaluation units differ for every source; no cross-study statistical test.
Zhu and Rodríguez-Miguel headlines are volume-level; Singh & Gorantla use fundus photographs. NR = not reported. The project's official-test values have no meaningful CI (perfect separation). Y-axis starts at 0.40.
