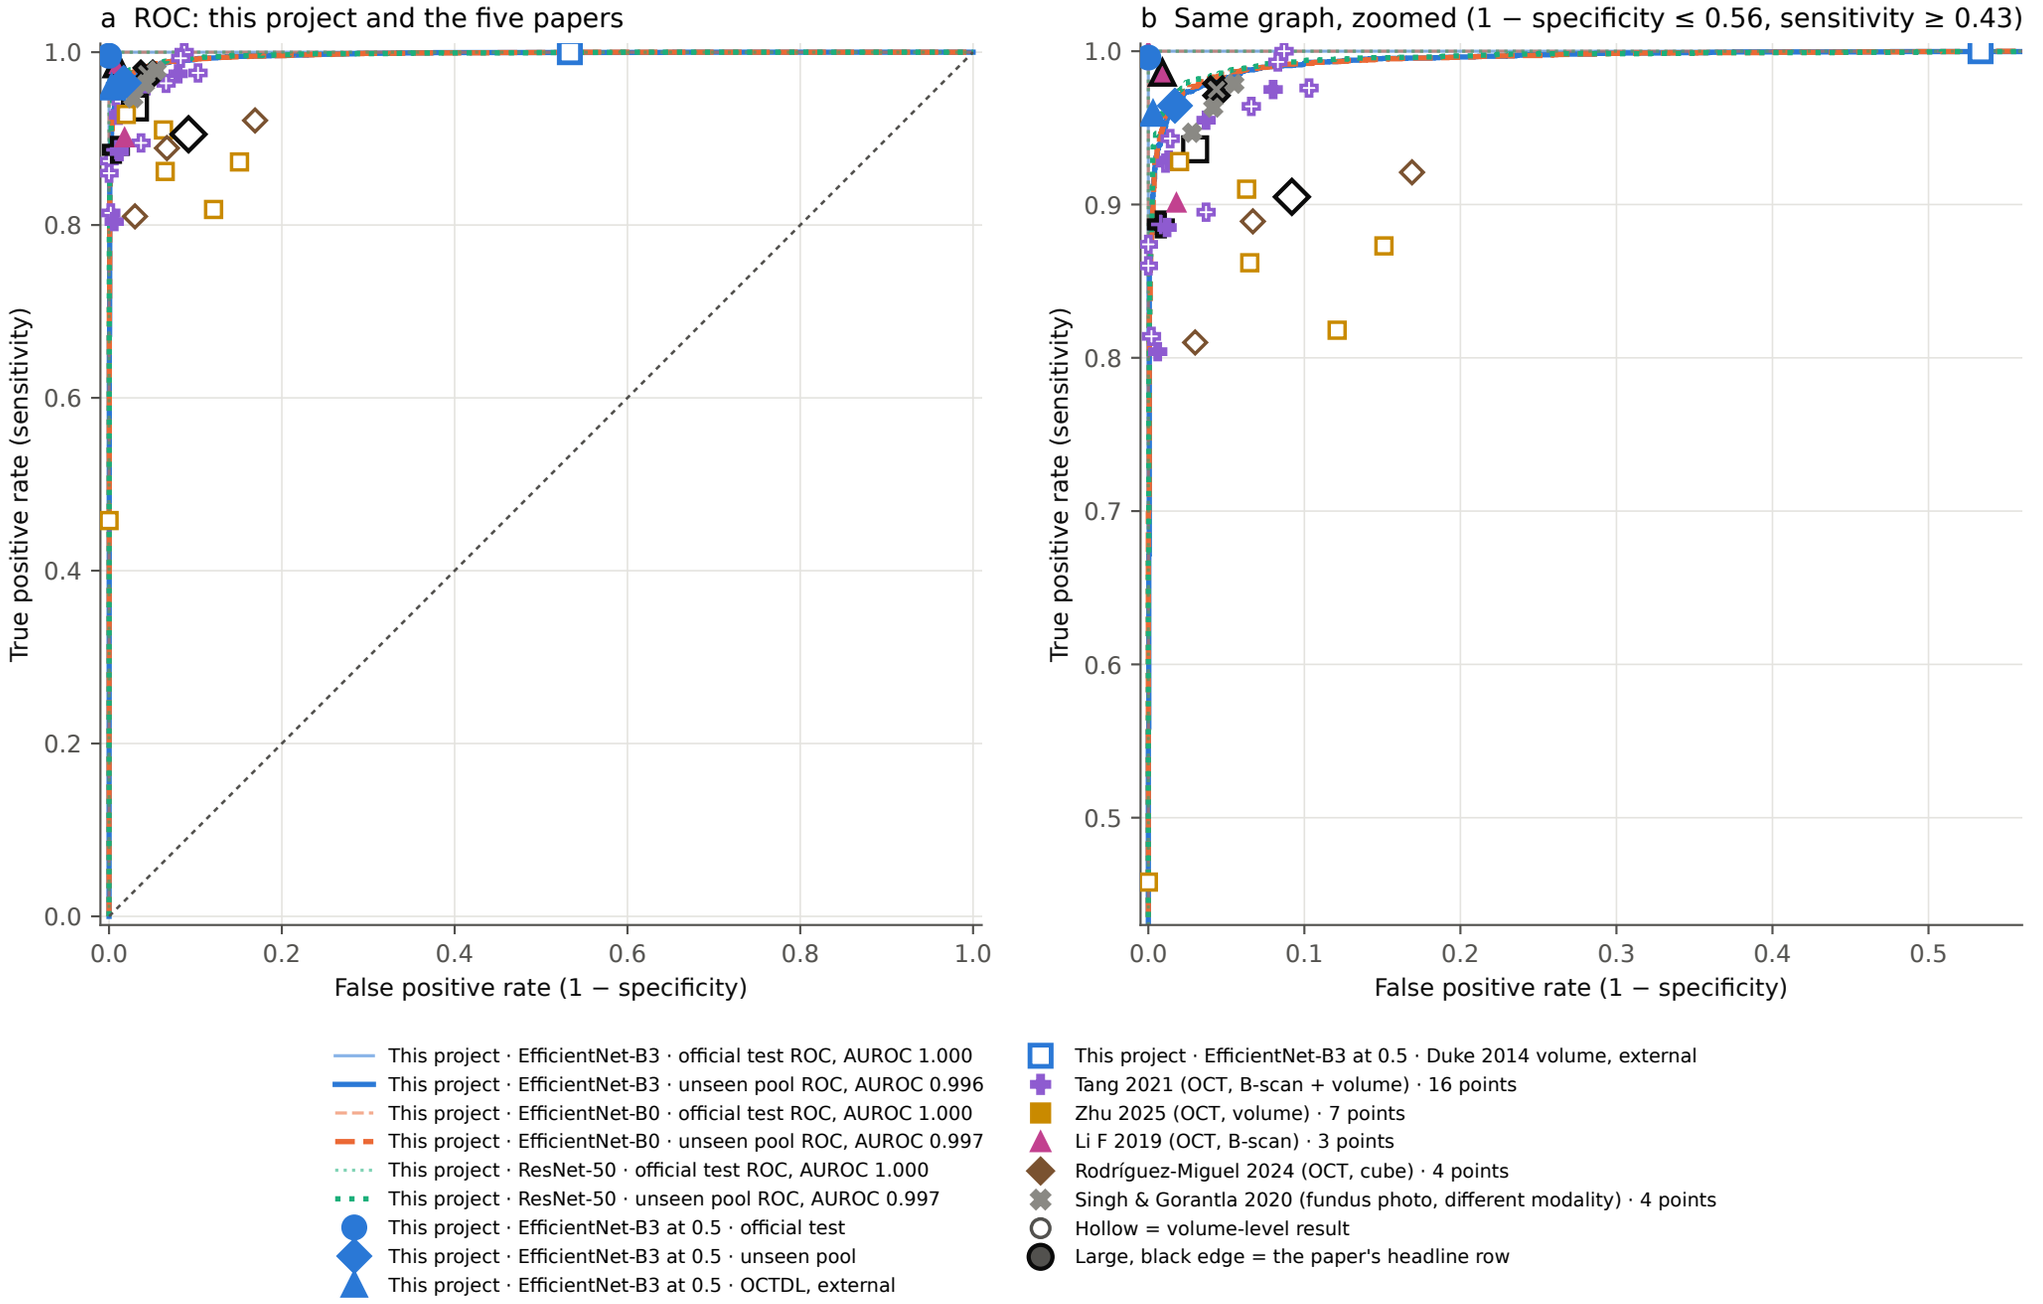
Receiver Operating Characteristic: This Project's Curves and the Five Papers' Published Operating Points



Project curves from continuous raw softmax P(DME) (temperature scaling is monotonic and leaves ROC unchanged): thin = official test (n=484; all three curves lie on the left and top axes, AUROC 1.000), thick = unseen pool (n=7,503). Published markers: one per DME-presence row with both sensitivity and specificity (per_paper_comparison.csv); filled = image level, hollow = volume level; large black-edged marker = the paper's headline row. Li 2019, Rodríguez-Miguel 2024 and Singh & Gorantla 2020 print ROC curves as images only; curves were not digitised. Rodríguez-Miguel internal-test rows report no sensitivity/specificity and are not plotted. Not a head-to-head comparison; no cross-study test.
