Audit Figure A1 — U-Net Fluid Segmentation Collapsed to All-Foreground (Not a Performance Figure)

Duke DME (Chiu et al. 2015), held-out subjects 06 and 07 (22 annotated B-scans; 8 with no fluid). Target: any manualFluid1 region; ungraded side margins (stored as 0) counted as background by segment.py; graded region = columns with manual layer annotations. Checkpoint from epoch 1 of 6.
The model labels 99.99% of every frame (including zero padding) as fluid; mean test Dice 0.0090 / IoU 0.0045 reflects this failure, not partial success. Examples = first fluid-positive and first fluid-free test scan in subject/scan order.
Comparison with the five papers: all five are classification-only (Tang 2021 explicitly segmentation-free); none reports a fluid-segmentation Dice, so no published values can be placed here.
